

## My Copenhagen Blinds:

Important: You are responsible for measuring for your blinds yourself. Therefore, it is important to make sure you get the measurements correct. The measurements you give, are the full height and width of the blinds (not of the window) incl. top tube, etc.

Consider how much space you want in top and bottom between the blinds and the surroundings.

And likewise, consider how much space you want in each side between the blinds and the surroundings.

Very few houses have completely right angles and straight lines. There are often some imbalances not visible to the eye but which will have impact on the blinds. We therefore recommend you measure your windows in minimum three places horizontally and minimum 2 places vertically.

Normally 5-10 mm of space in each side is enough – if the angles are straight. Likewise, we usually recommend 10-20 mm. space in total for top and bottom. However, sometimes it is recommended with more space.
